

ABSTRACT

A medication filling apparatus for filling a predetermined container with medications, such as tablets, provide improved assemblability and maintainability, and permits safe and reliable filling operations, while maintaining a compact size. The medication filling apparatus is equipped with a plurality of tablet cases for accommodating medications of respective types, a plurality of hoppers provided side by side below the respective tablet cases in a corresponding manner to receive the medications dispensed therefrom, and charging means for guiding the medications dispensed from a dispensing port formed at the bottommost portion of each hopper to a predetermined container and for charging them, and is further equipped with retaining members on which the hoppers are hung, wherein the hoppers are detachably installed to the retaining members.
